# BOOKHAF BULLETIN Vol. 47 - No. 33 August 20, 1993

BROOKHAVEN NATIONAL LABORATORY

### First RHIC Magnets Built by Industry Arrive at BNL

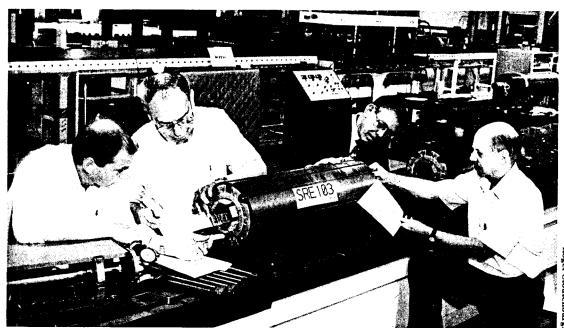

The first two of 300 superconducting sextupole magnets to be installed in the Relativistic Heavy Ion Collider (RHIC) arrived at BNL on August 9.

Built by Everson Electric Company of Allentown, Pennsylvania, they are the first superconducting magnets produced by U.S. industry for use in an accelerator.

Inspecting one of the newly arrived magnets are: (from left) Roy Lebel, a quality assurance engineer, and Melvin Lindner, a sextupole project engineer, both in the RHIC Magnet Division; Jay Redding, a senior contracts specialist in the Contracts & Procurement Division; and Erich Willen, Head of the RHIC Magnet Division.

Industry will manufacture nearly 1,200 of the 1,740 superconducting magnets needed to guide heavy ions around RHIC's two intersecting rings, each 3.8 kilometers (about 2.5 miles) long. Last October, BNL had signed a \$2.25 million contract with Everson to build sextupole and special trim quadrupole magnets for the collider.

The bulk of RHIC's superconducting magnets — dipoles and quadrupoles — will be built by Grumman Aerospace Corporation of Bethpage, New York. Grumman is gearing up for magnet production to begin later this year.

### Tech Transfer: The Emphasis Is on CRADAs

Over a decade ago, BNL formally established an office to promote the transfer of Brookhaven-developed technologies from the laboratory to the marketplace.

Today, that original effort, combined with the Lab's patent and licensing activities, has been expanded under the Office of Technology Transfer, headed by Sy Baron, Associate Director for Applied Programs.

According to the office's deputy manager, Margaret Bogosian, BNL has six main technology transfer mechanisms: patenting and licensing; personnel exchanges with other institutions; work for industry, universities and state and local government; the Lab's user facilities; an outreach effort to acquaint industry with BNL (see story about RHIC magnets); and — last on the list but quite effective — CRADAs.

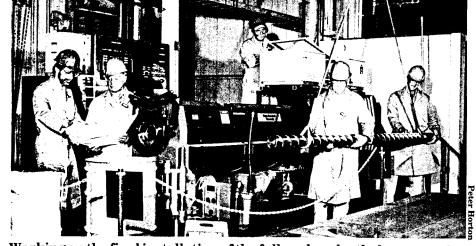

CRADAs, short for Cooperative Research and Development Agreements, have become a major focus of the tech transfer effort, with the federal government recently supporting significantly enhanced CRADA activity.

"CRADAs are aimed at U.S. industry," says Bogosian, explaining that, because they partner federally developed technology with the manufacturing and marketing know-how of industry, CRADAs can help boost U.S. economic competitiveness.

At present, BNL has 12 active CRADAs, with about eight more to be put in place soon. (Two of the Lab's active CRADAs are discussed in other stories in this issue.)

A look at the total dollars committed, both from the U.S. Department of Energy (DOE) and from the industrial partners, shows the increase in CRADA activity at the Lab.

In fiscal year 1992 (FY92), \$1.1 million was committed for CRADAs. For FY93, nearly \$1.7 million has been committed to date, with another \$3.7 million pending. For FY94, says Bogosian, "We expect that our CRADA funding from DOE will be close to \$6 million, with at least that amount in matching contributions from industrial partners." (continued on page 2)

Working on the final installation of the full-scale polyethylene extruder are members of the team applying this technology to the encapsulation of hazardous chemical waste: (from left) Paul Kalb, Peter Colombo, Don Cassidy (top), Cal Brewster and Jay Adams.

## **Developing Russian Materials For Commercial Use**

Since the breakup of the former Soviet Union, American technology in Russia is becoming more prominent, but new ideas in technology are also flowing from Russia to the U.S.

BNL scientists have been among the first to tap into this new source of scientific innovation — by using a plasma deposition system made in Russia. Recently transported from Moscow to Brookhaven, this system is being used to make a novel class of submicron-scale materials in BNL's Physics Department.

Formed from diamond-like carbon, quartz-like silicon oxide and atomicscale metallic clusters, these unique materials are called diamond-like nanocomposites (DLN). They are being investigated at Brookhaven to determine their suitability for use in commercial areas, particularly catalysis, under a Cooperative Research and Development Agreement (CRADA) with DFD Solid State Labs, Inc., of Farmingdale, New York.

Developed in the former Soviet Union in the 1970s, DLNs are now used in Russia as protective coatings for computer hard disks. The materials have many potential applications in industry, as they provide protection against corrosion, mechanical damwho

(continued on page 3)

## A New Job for Plastic — Containing Hazardous Waste

The next time you use a plastic bag, think of hazardous waste.

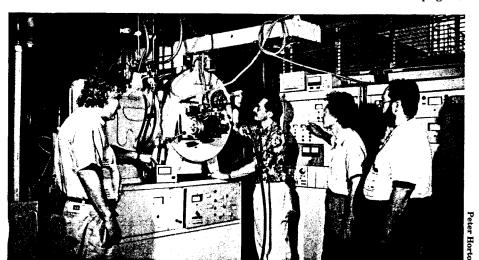

Why? Because the same kind of plastic that went into that bag may be used to contain the hazardous chemical waste in the future.

That plastic technology was first developed in BNL's Department of Advanced Technology (DAT), at the Environmental and Waste Technology Center (EWTC), headed by Peter Colombo. There, it is about to undergo a full-scale test after attracting interest from diverse industries.

To contain waste better and more safely, Paul Kalb, led EWTC's Waste Treatment and Disposal Group in adapting an established plastic-processing technique called extrusion to their purposes. "We haven't invented the equipment," Kalb said. "We've just found a new application for existing equipment."

The new application uses low-density polyethylene, or LDPE, a kind of thermoplastic polymer that is pliable enough to make bags, but sturdy enough to mix with hazardous, low-level radioactive and mixed wastes to make nearly inert blocks.

The U.S. Department of Energy (DOE) and commercial waste processors usually use cement for treating (continued on page 2)

Examining the plasma-deposition system recently transported from Russia to BNL are CRADA participants: (from left) Myron Strongin, BNL; Michael Abraizov, Polytechnic Institute; Benjamin Dorfman, DFD Solid State Labs, Inc.; and Mark Ruckman, BNL.

## It's a Spaceship . . . It's a Dirigible . . . It's a Bubble Chamber!

This intriguing, spaceship-like device surveys the Lab site from its station atop the hill next to the Science Museum, located in Bldg. 701, the former Brookhaven Graphite Research Reactor.

But it's not a spaceship: It's a bubble chamber. Within this device, particles interacted in liquid hydrogen, leaving bubbly tracks that were photographed and analyzed. Dubbed the 7-Foot Bubble Chamber, this instrument is part of BNL history. That's why it is placed, together with other historic equipment, next to the museum, which chronicles BNL's scientific efforts — past, present and future.

Hard by the bubble chamber is a small, rounded machine — a dingy beside a yacht. This is the 1.5-meter-(60-inch) in-diameter piston that built up pressure on the hydrogen, superheating it to the point at which nuclei could form for bubble growth.

The 7-Foot Bubble Chamber was constructed under the leadership of Ralph Shutt, now a senior physicist with the RHIC Project. It was first used for neutrino experiments at the Alternating Gradient Synchrotron (AGS) in 1974, by a BNL

group headed by Lab Director Nicholas Samios, then in the Physics Department. By spring 1975, data analysis provided the first observation of a single "charmed" particle—the charmed baryon, a particle made up of three quarks, one having the particle quality named charm. This finding reinforced the interpretation of the 1974 discovery of the J/psi particle, an important step in confirming that there was a new member of the quark family, the charmed quark.

The J particle was found at the AGS in a 1974, Nobel Prize-winning experiment by a Massachusetts Institute of Technology (MIT)/BNL group led by Samuel Ting, MIT.

The complex apparatus for the experiment included large detectors called Cerenkov counters, which sifted out signals from less interesting reaction products.

Spotted among these signals was the J.

At the same time, however, a group led by Burton Richter at the Stanford Linear Accelerator Center used a different technique to find a new particle that he called psi. It was the same particle, henceforth known as the J/psi, so the 1976 Nobel Prize was shared by Ting and Richter.

Still vivid with yellow paint and looking like a heavy-metal giant megaphone,

the Cerenkov counter used in the J-particle discovery also lies outside the Science Museum.

For more history on the hoof, step inside the Science Museum to see another famous bubble chamber, or rather, its 675-kilogram (1,500-pound), distortion-free window. Less than two weeks after the start of its first experiment at the AGS in 1964, the 80-Inch Bubble Chamber, as it was known, revealed a new particle: the Omega-minus. The new particle had a "strangeness" of -3, which had been

predicted by a theory called SU(3). Therefore, the Samios-led BNL/Rochester/Syracuse experimental team established the theory as correct, forming a solid foundation for the development of quark theory. — Liz Seubert

You can see the 7-Foot Bubble Chamber, the piston and the Cerenkov counter any time, but the Science Museum is only open for tours on two more Sundays this summer. To join a tour, stop by Berkner Hall on August 22 or 29, between 10 a.m. and 3 p.m.

— Photo by Roger Stoutenburgh

#### Scoop of the Week

The fifth Scoop of the Week for this season goes to Kumi Pandya, Department of Applied Science, who suggested the idea for this week's story on "... It's a Bubble Chamber!"

During the summer, if the Bulletin publishes a story

based on your idea, you too may win a Scoop of the Week, an official certificate for a free frozen dessert at the Cafeteria, compliments of Service America Corporation. To enter, send your hot tips to the Brookhaven Bulletin, Bldg. 134, or call Ext. 5053.

#### **Tech Transfer** (cont'd)

As reported in the May 28 BNL budget story in the Brookhaven Bulletin, President Clinton's budget for FY94 contains \$6 million earmarked for BNL's tech transfer activities, most of which will fund new CRADAs. In March, DOE asked the national laboratories to submit proposals for 1994 CRADAs. BNL's Office of Technology Transfer responded with 74 proposals, which covered a wide range of fields, from materials science to biotechnology to environmental technology.

Each one also met DOE's parameters: that the CRADA would have a term of one to three years; require \$100-500 thousand in DOE funding each year; use BNL's capabilities to meet industrial needs; and have promise of commercial impact, such as new products, more jobs or increased competitiveness.

"The increased funding for CRADAs reflects a strong commitment to tech transfer under the new administration," says Bogosian. She is quick to add, however, that there has long been advocacy for the transfer of federally owned technology to state and local governments and to the private sector. Today, the big difference is that the government is setting aside new money for CRADAs.

Costs for doing research and development under a CRADA agreement are shared between BNL and the industrial partner, with both contributing people, facilities, instruments and/or materials. The industrial partner may also contribute funds. Research results are exchanged, but patent and data rights are negotiated.

"I definitely see a different attitude now toward technology transfer, especially among the younger researchers trained at big universities that have an active involvement with industry and a more entrepreneurial climate," says Bogosian.

She also says that the more BNL scientists interact with the research community from industry, the more they realize the value of those interactions. "Our scientists have come to understand that, in most tech transfer programs, both the laboratory and the industrial partner benefit. Cross fertilization is very valuable," she comments

Bogosian adds that scientists understand the economic reality and the interrelationship between funding for research and technology utilization. She says, "The future of the laboratories is going to depend much more on our ability to show that we are relevant and can help the economic security of this country. One way to do that is to have active technology development programs with American industry." — Mona S. Rowe

#### **Plastic**

(cont'd)

these types of wastes because it is cheap and readily available. But cement also has some drawbacks.

#### Plastic vs. Cement

Cement's ability to harden depends on a chemical hydration reaction. So, Kalb said, "when you start adding chemical wastes, they may react and interfere, causing a failure to solidify or a product with poor durability."

When solidified waste forms fail, they do not adequately isolate contaminants from the accessible environment. This leads to the need for potentially difficult and costly remediation.

To search for an alternative, Kalb and his team set out more than 10 years ago to select and perfect a technology that would use plastic to do the same job, only better.

After settling on recyclable LDPE as a suitable material, they used a small-scale version of a device called an extruder to test the process' efficacy. The resulting test forms held up so well under rigorous environmental testing that the team has received DOE funding for a full-scale test, scheduled for the next fiscal year.

After years of perfecting the process, Kalb's team purchased a full production-scale extruder. Installation and modifications are now under way, and preliminary testing should begin next month.

#### **Tremendous Promise**

"I think this technology has tremendous promise, not only for stabilizing the waste forms we're using now, but also for stabilizing many

Catch a glimpse of **GLANCE** 

playing in Berkner Hall weekdays, 11:30 a.m. to 2:00 p.m. Show changes every Tuesday. other waste forms," said Romney Duffey, DAT Chairman. "We're customizing the process to each waste form."

The extrusion process combines melted LDPE with waste so that the plastic completely surrounds, or encapsulates, the waste particles. After being mixed by a rotating screw, the mixture is squeezed out to fill a mold, such as a 209-liter (55-gallon) drum. After cooling to a solid the drum then goes to an approved disposal site.

Diverse types of chemical waste can be encapsulated, including incinerator ash, which contains highly concentrated hazards from the trash it once was. Sludges, spent ion-exchange resins and concentrated waste left over from evaporation processes can also be sealed inside the plastic.

Despite the repeated success, Kalb said he has needed to convince some people that thermoplastic polymer encapsulation is economically efficient because raw LDPE is four-to-five times more expensive per pound than cement. But, tests have shown that it only takes a small amount of plastic to encapsulate a large amount of waste: an LDPE-waste form can contain up to 70 percent waste, compared with 15 to 20 percent for cement.

#### More Effective, Less Expensive

"At first look, it would appear that it's not economical, but better efficiencies mean fewer drums produced," he said. "In each case, we've been able to show that, compared with traditional cement solidification, this method is effective and significantly reduces costs."

For instance, for a plant generating a million kilograms of nitrate salts per year, the team's calculations have shown that encapsulation could save up to \$2.7 million by reducing by 70 percent the number of disposal drums needed.

With so much promise for the new technology, and the need to find disposal alternatives to satisfy a demanding regulatory system and public, DOE and industry alike have become even more eager to learn more about thermoplastic polymer encapsulation.

Kalb's team is also working on better ways to pretreat the waste streams for more efficient encapsulation, leading to more industry interest. Future research will investigate its applica-

### CRADA for Sealing Waste in Plastic

When Paul Kalb and his team wanted to investigate ways to pretreat waste before encapsulating it in polyethylene (see accompanying story), they went to Seattle's Pacific Nuclear Inc. for the right equipment.

Now, Pacific Nuclear has come to Kalb, showing interest in the waste-encapsulation process as a potential way to treat one of their industry's waste streams.

The company and Associated Universities, Inc., have entered a Cooperative Research and Development Agreement (CRADA) to test the efficacy of encapsulation as a means to solidify ion-exchange resins produced by the nuclear industry. Work is expected to begin soon.

"We went to them for their technology, and they came to us for ours," said Kalb, leader of the Department of Advanced Technology group that developed the encapsulation process for sealing hazardous chemical waste.—K.V.

bility to other waste types and the potential use of recycled plastics for encapsulating wastes.

"This is a technological improvement over what was previously available," Kalb said. "It reduces risk to human health and the environment in a cost-effective manner and will be available for implementation in several years."

— Kara Villamil

#### **IBEW Meeting**

Local 2230, IBEW, will hold its regular monthly meeting on Monday, August 23, at 6 p.m. in the Knights of Columbus Hall, Railroad Avenue, Patchogue. There will also be an afternoon meeting at 2 p.m. for shift workers in the Union office at 31 Oak Street, Patchogue. On the agenda will be regular business, committee reports, the president's report, installation of officers and the report of the Negotiation Committee.

#### Users' Group WordPerfect 5.1

The WordPerfect Users' Group will next meet on Tuesday, August 24, from 10 to 11 a.m., in the Computing & Communications Division seminar room, Bldg. 515. The topic will be "Inserting Graphic Images in WordPerfect Documents."

Seating is limited, so call group moderator, Pat O'Connor, Ext. 7341, by August 23, to confirm attendance.

#### **UNIX Training**

The schedule for UNIX training announced in last week's Bulletin has been revised as follows:

- Introduction to UNIX, \$300 Mon.-Thu., 9/20-23, 8:30 a.m. to noon Fri., 9/24, 8:30 a.m. to 5 p.m.
- C Shell Programming, \$200 Mon. - Thu., 9/20-23, 1 to 5 p.m.

Classes will meet in the Computing & Communications Division seminar room, Bldg. 515. To register, send an ILR for the correct amount, to Pam Mansfield, Bldg. 515, before August 25. For more information, contact Mansfield, Ext. 7286.

### 1993-94 BERA Concert Series Arrives Early With the Guild Trio

The Guild Trio, a Long Island-based ensemble that gave an acclaimed performance at BNL in February, will be back for an encore. They will give a special summer concert in Berkner Hall on Tuesday, August 24, at 8 p.m., bringing an early start to the 1993-94 BERA Concert Series.

Formed at the State University of New York (SUNY) at Stony Brook in 1988, the gifted trio, a pianist, violinist and cellist, has already won a world-class reputation. Only three months after its formation, the ensemble won the prestigious Artistic Ambassador Competition. In 1990, the group was honored as the trio-in-residence at Tanglewood Music Center.

The Guild Trio holds a unique residency at the Institute for Medicine in Contemporary Society at SUNY at Stony Brook's Medical School. They coach amateur musicians from the University Hospital and Health Sci-

uid solutions containing carbon and

silicon into an argon plasma, an ex-

tremely hot ionized gas. This plasma

breaks up the reactants into atoms of

carbon, hydrogen, silicon and oxygen.

By controlling the plasma environ-

ment and adding metals, the research-

ers modify the deposition of the atoms

microns thick," said Dorfman. "We

"We are making DLN thin films

The Guild Trio

to grow DLNs.

ences Center, as well as perform and tape concerts to show to patients.

The program for the Brookhaven concert consists of Beethoven's Trio VIII in GMajor, Opus 121a, "Kakadu"; "To the Spirit Unconquered" (1992), inspired by Primo Levi's writings on the Holocaust and composed by Sheila Silver; and Brahms' Quartet in G minor, Opus 25.

The Guild Trio performance will be the first in a series of five concerts at BNL, which will also include:

- Aeolian Chamber Players, Wednesday, October 27
- Ruth Laredo, Pianist, Wednesday, December 1
- The Baltimore Consort, Wednesday, February 9
- The Fresk Quartet, Thursday, March 17

All of the concerts begin at 8 p.m. in Berkner Hall. Tickets can be purchased at the door the night of the performance. Prices are \$14, general admission; \$9, students and people over 65; and \$5, youths under 18.

Block tickets will be honored at any concert and can also be bought at the door at The Guild Trio performance. At \$10 each for a minimum purchase of four, block tickets may be purchased before the first concert at the BERA Sales Office, weekdays from 9 a.m. to 1:30 p.m., or from any of the following:

**Materials** 

(cont'd)

age and ultraviolet light. The chemically stable, strongly adhesive materials can be used as both electrical insulators and conductors.

In addition to contributing the machinery needed to make these new materials, DFD Solid State Labs, Inc., a small, two-year-old company that specializes in technology transfer projects, brings to the CRADA the expertise of Benjamin Dorfman, one of the Russian scientists who developed the technology for making DLNs. Michael Abraizov, another scientist who worked on the materials in Russia and is now employed at the Polytechnic Institute in Farmingdale, is also a member of the CRADA team. The principal BNL researchers are Myron Strongin and Mark Ruckman, both from the Physics Department.

"This novel class of materials has tremendous commercial potential," said Strongin. "Many applications are feasible, from use as a protective coating for integrated circuits or plastics, to using the materials as catalysts."

DLNs are formed by injecting liq-

have experimented with approximately 20 different metals so far. We use no more than three atoms of metals in each particle of the material. In particles of this atomic-scale size, novel properties emerge."

The plasma-deposition system developed in the former Soviet Union has unique features that are not commonly

and evaluate Russian equipment," Strongin commented.
Instrumental in getting the plasma deposition system to function was Michael Carroll, a technical specialist in Physics who pieced together machinery after it arrived badly damaged at BNL in a steel shipping container insufficiently braced with only

a few two-by-fours.

used in the U.S. "Apart from making an

interesting new class of materials, this

project provides an opportunity to use

"The electronics were damaged, and the equipment's heavy steel doors were unbolted," said Carroll. "All the instruction manuals were written in Russian. The scientists helped me to interpret them, and I acted as liaison between electricians, plumbers, Safety and Environmental Protection Division personnel and other technicians to get the system working. It worked the first time we tried it — six weeks after the system arrived."

Next, the BNL scientists will study the atomic structure, bonding and stability of DLNs using various x-ray probe techniques at the National Synchrotron Light Source. They will also work with materials scientists from BNL's Department of Applied Science on further characterization of the novel materials' chemical and physical properties.

Funding for Brookhaven's participation in the CRADA comes from the U.S. Department of Energy's Laboratory Technology Transfer Program and Basic Energy Sciences Program.

— Diane Greenberg

## Apple Support Continues on Site

Over the past 18 months, the onsite use of Apple computers has nearly doubled to more than 300 systems. Therefore, the Computing & Communications Division (CCD) is supporting these computer users with the newly formed PC Resource Center.

Recognizing the importance of Apple support, CCD has arranged for Michael Borowski, formerly of Custom Computer, to work temporarily at BNL, assisting users with configuration and applications support, particularly during the critical fiscal yearend period.

The Apple sales office will have representatives from Government Technology Services, Inc., on site regularly, so users can get product information on the Apple line, as well as PC add-ons. Look for additional information in the Brookhaven Bulletin and LINK.bnl. as plans are made final.

#### Concert, Picnic This Weekend

Two special events to be held on site this weekend are open to all BNLers and their families and friends:

• BERA's Bluegrass Concert, tonight, on the lawn behind the Brookhaven Center\* — The outdoor concert by Buddy Merriam & Back Roads will begin at 7 p.m. Bring your own lawn chairs, blankets and snacks. In case of rain, the concert will be held in Berkner Hall.

At \$7 for adults and \$3 for children, tickets are on sale until 1:30 p.m. today in the BERA Sales Office; after 1:30 at the Recreation Office in Personnel, Bldg. 185; or from any of the following: April Donegain, Ext. 2459; Andrea Epple, Ext. 4424; Skelly Frei, Ext. 7898; Augie Hoffmann, Ext. 3884; Pat Manzella, Ext. 3336; Betty Pergan, Ext. 2937; Rosalie Piccione, Ext. 3160; Bridget Ramos, Ext. 3452; or Mary Ann Reynolds, Ext. 5241. Tickets will also be sold in the lobby of the Brookhaven Center before the performance.

\*Please note change of location.

• Afro-American Culture Club Annual Picnic — Good food, great music by E.T., fun and games will highlight this picnic tomorrow, August 21, from noon to 6 p.m. in the gazebo area of the BERA fields.

Tickets are \$5 for adults and \$3 for children under 12. Purchase tickets today from April Donegain, Ext. 2459; Pauline Dixon, Ext. 2164; Sarah Ebron, Ext. 2232; or Barbara Kponou, Ext. 5104; or buy them tomorrow at the gate.

#### **Camera Club**

The results of the BNL Camera Club's live model shoot, held last month, will be presented at the club's next meeting on Thursday, August 26, at noon, in Berkner Hall, Room C. All interested persons, including the models and those who missed the actual shoot, are invited to see and discuss the photographs.

#### **Arrivals & Departures**

#### Arrivals

### BROOKHAVEN BULLETIN

Published weekly by the Public Affairs Office for the employees of BROOKHAVEN NATIONAL LABORATORY

ANITA COHEN, Editor MARSHA BELFORD, Assistant Editor

Bldg. 134, P.O. Box 5000 Upton NY 11973-5000 Tel. (516) 282-2345; Fax (516) 282-3368

#### **Amateur Radio Club**

The BERA Amateur Radio Club will next meet in Berkner Hall, Room D, on Thursday, August 26, at noon. All Lab employees, guests and licensed amateur radio operators are invited.

For more information, contact Chris Neuberger, Ext. 4160, or Nick Franco, Ext. 5467.

#### **Call for Bowlers**

Applications for bowling with the Tuesday night men's league in Port Jefferson and the Thursday night mixed league in Shirley are now at the BERA Sales Office.

Priority registration for existing teams is due by August 20; new team registrations are due by August 27. A captains' meeting will be held on Wednesday, September 1, at noon, in Berkner Hall, Room B.

All willing bowlers are welcome. For information, contact Ray Raynis, Ext. 3536, or Maryann Reynolds, Ext.

#### Classified Advertisements

#### **Placement Notices**

The Laboratory's placement policy is to select the best-qualified candidate for an available position. Consideration is given to candidates in the following order: (1) present employees within the department division and/or appropriate bargaining unit, with preference for those within the immediate work group; (2) present employees within the Laboratory; and (3) outside applicants. In keeping with the Affirmative Action plan, selections are made without regard to age, race, color, religion, national origin, sex, handicap or veteran status.

Each week, the Personnel Division lists new placement notices. The purpose of these listings is, first, to give employees an opportunity to request consideration for themselves through Personnel, and second, for general recruiting under open recruitment. Because of the priority policy stated above, each listing does not necessarily represent an opportunity for all people.

Except when operational needs require otherwise, positions will be open for one week after publication. For more information, contact the Employment Manager, Ext. 2882, or call the JOBLINE, Ext. 7744 (282-7744), for a complete listing of all openings.

SCIENTIFIC RECRUITMENT - Candidates may apply directly to the department representative named. SCIENTIST/ENGINEER - With experience in advanced reliability theory, statistical analysis, probabilistic safety analysis and optimization theory, to join an aging-risk assessment program. Contact: Pranab Samanta or Robert Hall, Department of Advanced Technology

RESEARCH ASSOCIATE-Trained in inorganic chemistry, with research experience in the development of new materials and processes for the treatment of hazardous, radioactive and mixed wastes, to participate in an experimental R&D effort aimed at new and improved treatment processes for low-level radioactive and mixed wastes. Contact: Peter Colombo, Department of Advanced Technology

**LABORATORY RECRUITMENT** - Opportunities for Laboratory employees

DD 2727. ADMINISTRATIVE POSITION - Requires AAS/BS in accounting and several years' experience in cost and/or construction accounting. Responsibilities include the application of accounting principles for charges pertaining to the special maintenance program, contract labor, general plant projects, IHEM, line items and special studies. Additional duties will include checking invoices, recording and checking contract charges, preparing reports and accrual documents, and reconciling cost records to BNL ledger. Knowledge of computer spreadsheet programs, preferably EXCEL or Lotus required. Knowledge of PC networks, PC databases and IPAP/JCARS desired. Plant Engineering Division.

**OPEN RECRUITMENT** - Opportunities for Laboratory employees and outside candidates

NS 0730. GENERAL SUPERVISOR, STAFF SER-VICES - Requires a bachelor's degree, or equivalent, in a relevant field, and extensive pertinent experience. Major areas of oversight and responsibility are automotive fleet operations, transportation and communications services. Extensive experience in two of these areas is required; large automotive-fleet operations and PC business-applications experience is highly desirable. In addition, will be responsible for property, recycling, security, contracts, safety, quality assurance, building and budget management within division. Staff Services Division.

NS 8180. ENGINEERING POSITION - Requires a master's degree in health physics/industrial hygiene or equivalent, or substantial experience in operational radiation protection. Certification in HP or IH is required as are demonstrated management abilities, and excellent written and oral communication skills. Familiarity with DOE ESH program requirements and accelerator or reactor programs a plus. Will be responsible for planning and leading a diverse staff of health and safety professionals and technicians. Must be able to obtain/maintain a security clearance. Safety and Environmental Protection Division.

LS 0419. X-RAY TECHNICIAN POSITION - Requires New York State license as diagnostic radiology technician. Responsibilities include taking x-rays, performing quality-assurance procedures and maintaining records for radiology as part of Occupational Medicine Clinic physical exams. Additional responsibilities may be assigned for related exam procedures. Training will be provided. Medical Department.

LS 8181. ENGINEERING POSITION - Requires MS or equivalent in health physics or physical science, plus several years' pertinent health physics experience, demonstrated supervisory background and good oral and written communication skills. Knowledge of current health physics regulations, dosimetry principles, TLDs, SOPs, quality control and computer skills are desired.
